

# **EVALUATING HTTP PERFORMANCE FROM STREAMS**

## **ACCEPTANCE TEST PLAN**

- **Team Name:** NAGIOS
  
- **Team Members:**
  - Atla Prashant
  - Chilukuri, Megh Phani Dutt
  - Garg, Prafull
  - Grandhi, Veera Venkata Santosh S G
  - Kalidindi, Rajeev Varma
  - Kolli, Samuel Sushanth
  - Madala, Sravya
  - Musinada, Suren
  - Naguru, Sriram Prashanth
  - Peddireddy, Divya
  - Rajana, Poojitha
  
- **Document Type:** Design Document
  
- **Version Number:** Version 1.3
  
- **Publication Date:** August 24<sup>th</sup>, 2015

# 1. PREFACE:

This project is concerned with evaluating HTTP performance from streams. We describe the version release v1.3, where we elucidate the acceptance test plan for this project.

The document is partitioned into various sections. Section 2 gives an overview of the abbreviations used in this document. Section 3 gives a description of the purpose of the modules and its place in the high level architecture. It describes the acceptance test plan for every module in detail. The last section describes the references used to prepare this document.

## Release v1.3 on 2015-08-24

### ➤ Updated release

Version history is as follows:

PUBLICATION DATE	VERSION	DESCRIPTION	CHANGES
2015-08-24	v1.3	Updated Version	Updated the following from feedback of the CEO: <ul style="list-style-type: none"><li>• Improved detailed test descriptions and their execution.</li><li>• Corrected module numbers for the tests.</li><li>• Importing data via a REST API.</li></ul>
2015-06-01	v1.2	Updated Version	Updated the following from feedback of the CEO: <ul style="list-style-type: none"><li>• Detailed description on how to execute the tests.</li></ul>
2015-05-20	v1.1	Updated Version	Updated the following from feedback of the CEO: <ul style="list-style-type: none"><li>• Included subheadings and tests for the modules.</li></ul>
2015-05-14	v1.0	Initial Release	

## **2. GLOSSARY AND ABBREVIATIONS:**

### **HTTP: Hypertext Transfer Protocol**

It is a protocol at the application level for communication of data between the network elements such as clients and servers.

### **GUI: Graphical User Interface**

An interface which allows the users to communicate with the electronic devices through visual icons. In some cases, it contains audio feedback as well as voice control.

### **DPMI: Distributed Passive Measurement Infrastructure**

This interface is used to read the data stream at various measuring points.

### **RESTful: Representational State Transfer**

An architectural pattern to improve portability, scalability of the system.

### **API: Application Programming Interface**

This specifies how software components should interact with each other.

### 3. ACCEPTANCE TEST PLAN:

#### ➤ Test Specifications:

#### 3.1 FILTERING HTTP PACKETS IN BACK END:

<b>Test</b>	TEST_MOD_1
<b>Purpose</b>	To test the T-shark output
<b>Requirements</b>	USR_REQ_FR1,SYS_FR1,SYS_FR2
<b>Environment</b>	Ubuntu 14.04, LTS
<b>Operation</b>	<p>To Check whether required HTTP packets are filtered or not.</p> <p>In Ubuntu operating system; we capture the packets by using libcap_utils in DPML. libcap_utils consists of functions such as cap2pcap; cap dump; cap show etc.</p> <p>Capdump generates a .cap file. Here, -i specifies the interface, which is Ethernet 2 of DMPI, from where the TCP packets are being captured. We capture 40,000 packets passing through Port 80, from streams 71 and 72.</p> <pre>&lt;capdump -i eth2 -tcp -P 80 -p 40000 01::72 01::71 -o nagios.cap&gt;</pre> <p>Cap2pcap converts a .cap file into .pcap. It is done as this file format is accepted by T-Shark.</p> <pre>&lt;cap2pcap -o nagiosout.pcap nagios.cap&gt;</pre> <p>T-shark is used to filter the HTTP packets. nagiosout.pcap file is given to T-Shark. The command below is used to filter HTTP packets, along with required parameters. It consists of fields like HTTP Request-Response methods; TCP sequence length; TCP acknowledgment number; Epoch time; source and destination IP; source and destination port number; frame length for each HTTP packet all sorted uniquely and store into a text file</p> <pre>&lt;tshark -r nagiosout.pcap -T fields -e http.request.method -e http.response.code -e tcp.len -e tcp.seq -e tcp.ack -e frame.time_epoch -e tcp.srcport - e tcp.dstport -e ip.src -e ip.dst -e frame.len   sort   uniq -c &gt; nagiostext1.txt</pre>
<b>Expected Result</b>	We successfully filter HTTP packets from captured network traffic.
<b>Result</b>	Successfully, we filtered the HTTP packets using T-shark.

<b>Comment</b>	<p>The user can check the filtering of HTTP packets using Wireshark.</p> <p>Wireshark is a free and open source packet analyzer with GUI, which can be downloaded.</p> <p>Follow the steps below:</p> <p>The user can give the generated .pcap file as input to Wireshark and use the filter HTTP. This gives the details of all the HTTP packets and their corresponding parameters.</p> <p>He can also generate a sample .pcap file using Wireshark and give it to T-Shark, to check if the HTTP packets are filtered or not.</p>
----------------	---

### 3.2 CALCULATING AND MONITORING THE PERFORMANCE METRICS IN BACK END:

<b>Test</b>	TEST_MOD_2
<b>Purpose</b>	<p>Calculate the performance metrics:</p> <ol style="list-style-type: none"> <li><b>1.Request response time</b></li> <li><b>2.Server bit rate</b></li> <li><b>3.Lost requests</b></li> </ol>
<b>Requirements</b>	USR_REQ_FR2, USR_REQ_FR3, USR_REQ_FR4, SYS_FR2
<b>Environment</b>	Ubuntu 14.04 LTS
<b>Operation</b>	<p>From the log file (nagiostext1.txt), we have written a Perl script to calculate the three above mentioned performance metrics mentioned under “purpose”.</p> <p>The user can run the Perl script “newf.pl”.</p> <p>Request response time:</p> <p>He can subtract the epoch times of the HTTP request with a corresponding response to calculate the request-response time.</p> <p>Server bit rate:</p> <p>The server bit rate is calculated as the ratio of “sum of frame lengths of all the responses sent by a server” to “difference of epoch times of last response and first response.</p> <p>Lost requests:</p> <p>These are the HTTP requests which didn’t receive any HTTP response from the server.</p>
<b>Expected Result</b>	<p>The three performance metrics –</p> <p>Request-Response time, Server bit rate and Lost requests should be obtained.</p>

<b>Result</b>	Request-Response Time, Server Bit Rate, Lost Requests are calculated successfully.
<b>Comment</b>	<p>We tested the functionality of the Perl script “newf.pl” as follows:</p> <p>We generated a sample .pcap file using Wireshark. We noted down the parameters required for our calculations. And manually checked the calculations of Request-Response Time, Server Bit Rate and Lost Requests for 20 IPs and checked the result with the output obtained from the Perl script “newf.pl”.</p> <p>This script was then modified to use in real time environment with DPMI.</p> <p>The user can use the sample .pcap file generated in TEST_MOD_1, if possible.</p>

### 3.3 USER AUTHENTICATION IN FRONT END:

<b>Test</b>	TEST_MOD_3
<b>Purpose</b>	To test the login authentication
<b>Requirements</b>	USR_REQ_FR8, SYS_FR3
<b>Environment</b>	Ubuntu 14.04 LTS
<b>Operation</b>	<p>The user first registers through the Web GUI. He should enter a proper username and password and click the login button.</p> <p>If the entered username and password match with those on the database, the login is a success. An alert is displayed on the Web dashboard. Else, a failed alert is displayed.</p>
<b>Expected Result</b>	The login should be successful
<b>Result</b>	Login is successful.
<b>Comment</b>	<p>To test the functionality of this module, the user should check whether the details entered by him are successfully being stored in the database.</p> <p>He can access the database through PHPMysqlAdmin.</p>

### 3.4 DISPLAYING GRAPHS USING RRD IN FRONT END:

<b>Test</b>	TEST_MOD_4
<b>Purpose</b>	To obtain graphs from RRD for the three performance metrics: Request-Response Time, Server Bit Rate, Lost Requests.
<b>Requirements</b>	USR_REQ_FR5, SYS_FR4
<b>Environment</b>	Ubuntu 14.04 LTS
<b>Operation</b>	The user should select the desired server metrics option and the server's IP address. He should be able to see the list of servers and their corresponding IP addresses in the WEB GUI. The graphs must be displayed corresponding to the IP on clicking the submit button.
<b>Expected Result</b>	We must be able to see the graphs on hourly, daily, monthly basis.
<b>Result</b>	Graphs are being displayed successfully.
<b>Comment</b>	To test the functionality of this module, the user should make sure that php5-rrd is installed. The RRDs which are being formed are continuously being updated and the corresponding images are formed. He can use different RRD functions like rrdtool dump, rrdtool fetch to check the values in a particular RRD. (eg). rrdtool dump <rrd-file-name>

### 3.5 THRESHOLD LEVELS IN FRONT END:

#### 3.5.1 DISPLAY MYSQL DATA IN FRONT END:

<b>Test</b>	TEST_MOD_5
<b>Purpose</b>	To Display MYSQL data in the front end
<b>Requirements</b>	USR_REQ_FR5;SYS_FR1,SYS_FR2
<b>Environment</b>	Ubuntu 14.04 LTS
<b>Operation</b>	When the User accesses the GUI, he should be able to see the IP addresses of all the servers, When he selects the thresholds option, he must be able to see all three performance metrics- Request-Response time, Server Bit Rate, Lost Requests of all IP addresses.
<b>Expected Result</b>	The table containing the Request-Response Times, Server Bit Rate, Lost Requests corresponding to their respective IPs should be displayed in the GUI.
<b>Result</b>	MySQL data is being successfully displayed in the front end.

<b>Comment</b>	To test the functionality of this module, the user should make sure that the database is created, the table containing the performance metric values is not empty. He can access the database through PHPMyAdmin and check this. Also, there should be a successful connection between the front end and MySQL database.
----------------	--

### 3.5.2 FAULT NOTIFICATIONS VIA E-MAIL:

<b>Test</b>	TEST_MOD_6
<b>Purpose</b>	To send a fault notification in the form of an e-mail
<b>Requirements</b>	USR_REQ_FR7, SYS_FR1, SYS_FR2
<b>Environment</b>	Ubuntu 14.04 LTS
<b>Operation</b>	<p>Fault notifications are sent when the threshold limit of the servers reaches a critical state.</p> <p>The user enters his e-mail id during registration. This email id is used as the default email id to send fault notifications.</p> <p>In user-defined threshold values, the fault notifications are sent to the email id provided.</p>
<b>Expected Result</b>	The user must receive an email as soon as the threshold limits are exceeded.
<b>Result</b>	Threshold notifications are being sent via email.
<b>Comment</b>	

### 3.5.3 ASSIGNING THRESHOLD LEVELS IN FRONT END:

<b>Test</b>	TEST_MOD_7
<b>Purpose</b>	To check whether the threshold levels are set or not
<b>Requirements</b>	USR_REQ_FR6, SYS_FR1, SYS_FR2.
<b>Environment</b>	Ubuntu 14.04,LTS
<b>Operation</b>	<p>If the user wishes to change the default threshold levels, he can do so by assigning in the frontend.</p> <p>The assigned value is compared to the performance metric value in the database. The corresponding threshold level is displayed (using various color codes) in the GUI.</p>
<b>Expected Result</b>	The threshold levels should be displayed as per the specified range (normal-green, critical-orange, warning-red)

<b>Result</b>	The threshold levels are being successfully assigned and displayed in the front end.
<b>Comment</b>	To check the functionality of this module, the user can compare the default threshold values with those being displayed in the table in the front end. Similarly, he can check the user-defined threshold levels.

### 3.6 RESTful API:

#### 3.6.1 EXPORTING DATA:

<b>Test</b>	TEST_MOD_8
<b>Purpose</b>	To export data through a RESTful API
<b>Requirements</b>	USR_REQ_FR9
<b>Environment</b>	Ubuntu 14.04 LTS
<b>Operation</b>	<p>The third party user is provided with a URL to access the desired performance metrics in JSON format:</p> <p>URL:</p> <p>http://”server-IP-address”/web/rest2.php/?value=REQRESP</p> <p>http://”server-IP-address”/web/rest2.php/?value=BITRATE</p> <p>http://”server-IP-address”/web/rest2.php/?value=LOSTREQ</p> <p>This URL connects to the database of the system running the tool, and retrieves the corresponding metrics from the database.</p>
<b>Expected Result</b>	The selected performance metric and the corresponding IP address should be visible to the user in JSON format.
<b>Result</b>	Exporting data to a third party in JSON format via REST API is successful.
<b>Comment</b>	<p>To test the functionality of this module, the user should make sure that a connection is established between the third party user, the system running this tool and the database.</p> <p>He can ping the system. He can compare the values being displayed via REST API with those stored in the database.</p>

### 3.6.2 IMPORTING DATA:

<b>Test</b>	TEST_MOD_9
<b>Purpose</b>	To import data through a RESTful API
<b>Requirements</b>	USR_REQ_FR10
<b>Environment</b>	Ubuntu 14.04 LTS
<b>Operation</b>	<p>A third party user can import data into the database of the system which runs this tool.</p> <p>The user uploads a .csv/.json file through a web dashboard, whose contents are stored into the 'CSV_TBL' table in the database.</p> <p>URL:</p> <p>http://”server-IP-address”/web/uploadform.php (for .csv file)</p> <p>http://”server-IP-address”/web/jsonform.php (for .json file)</p> <p>The above URL connects to the database, and transfers the contents of the file into “CSV_TBL” of the database.</p>
<b>Expected Result</b>	The file uploaded by the user should be available in the “web” folder and the contents of the file should be automatically updated in the table “CSV_TBL” of the database.
<b>Result</b>	Importing data in the form of a .csv and .json file via a REST API is successful.
<b>Comment</b>	<p>This API was developed using PHP Curl. It must be installed on the system running this tool.</p> <p>To test the functionality of this module, the user should make sure there is a successful connection between the third party user, the system running the tool and its database.</p>
